Object-Oriented Design Lecture

Adding a Die and a DieHandle: A Case of Double Dispatch

What You Will Learn

- How conditionals can be turned into extensible design using messages
- Basis for more complex situation such as the Visitor Design Pattern

Remember Die and DieHandle

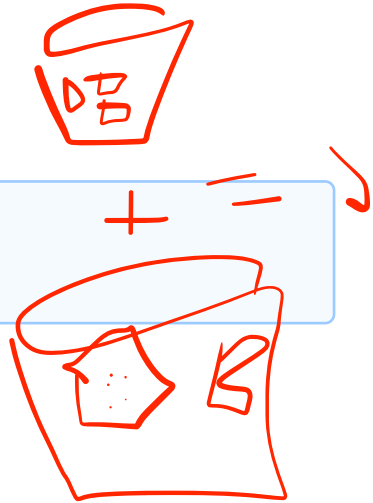
We create a die handle and add some die to it

```
| handle |
handle := DieHandle new
    addDie: (Die withFaces: 6);
    addDie: (Die withFaces: 10);
    yourself.
handle roll
```

Remember DieHandle

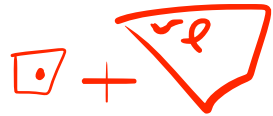
We add dieHandle together as in role playing games

```
DieHandleTest >> testSumming
  | handle |
  handle := 2 D20 + 3 D10.
  self assert: handle diceNumber = 5.
```



- We could add dices to a dice handle
- We could add dice handle to another dice handle

New Requirements



We want to add two dices together

```
(Die withFaces: 6) + (Die withFaces: 6)
```

Now we want to be able to add a dice to an dice handle

```
(Die withFaces: 6) + 2 D20
```

```
2 D20 + (Die withFaces: 6)
```

aNewRequirement asTest

```
DieTest >> testAddTwoDice

  | hd |
  hd := (Die withFaces: 6) + (Die withFaces: 6).
  self assert: hd dice size = 2.
```

```
DieTest >> testAddingADieAndHandle
  | hd |
  hd := (Die faces: 6)
    +
    (DieHandle new
      addDie: 6;
      yourself).
  self assert: hd dice size equals: 2
```

First adding two dice

```
Die >> + aDie

  ^ DieHandle new
      addDie: self;
      addDie: aDie;
      yourself
```

Limits

```
Die >> + aDie

    ^ DieHandle new
        addDie: self;
        addDie: aDie;
        yourself
```

But aDie can be

- a dice
- a die handle

A first step

Adding two dice is usefull, let us keep it and rename it:

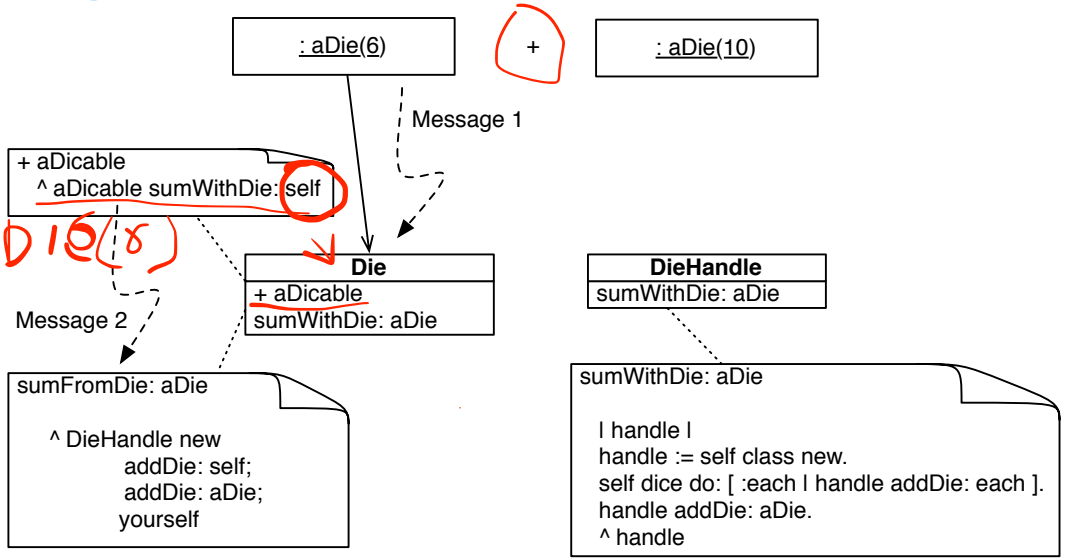
```
Die >> sumWithDie: aDie

  ^ DieHandle new
      addDie: self;
      addDie: aDie; yourself
```

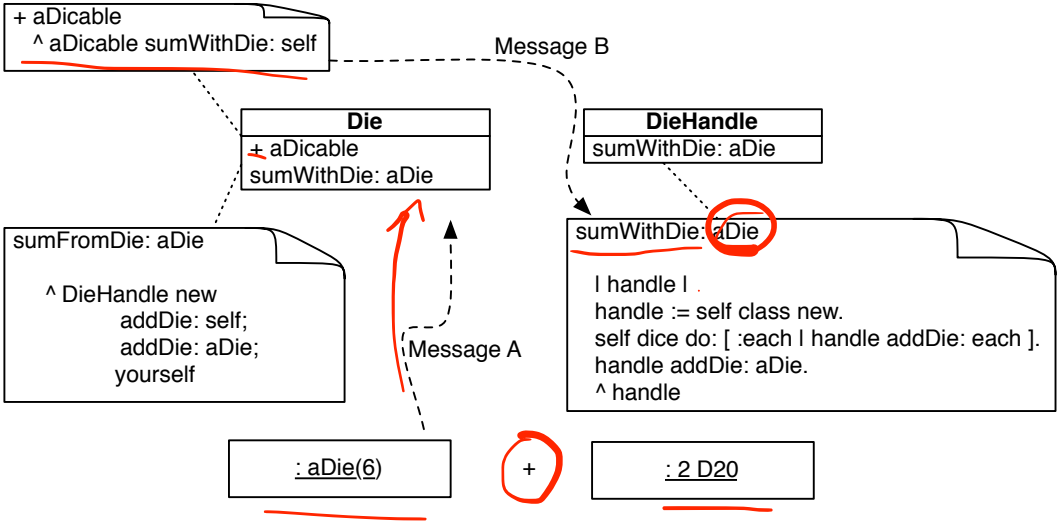
Now we just say to the argument that we want to add a die

```
Die >> + aDicable
    ^ aDicable sumWithDie: self
```

Adding Two Dice and Ready for More



Handling DieHandle as Argument



Our approach

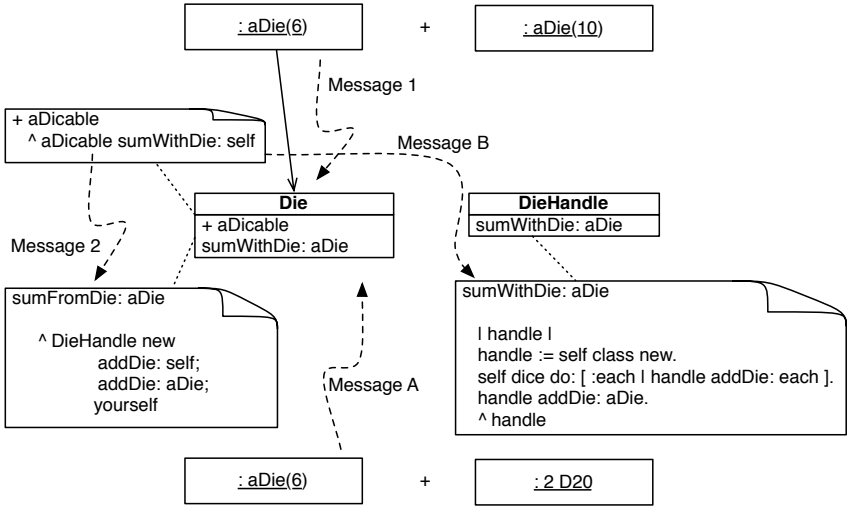
- When we add two elements (die or dieHandle) together.

We always do the same:

- we tell **the argument** that we want to add the receiver
- we are explicit about the receiver state since we know it
  - when the receiver is a die we say to the argument that we want to add a die
  - when the receiver is a die handle we say to the argument that we want to add a die handle

Let us do it now!

Sending a Message is Making a Choice



DieHandle as a receiver

We apply the same principle

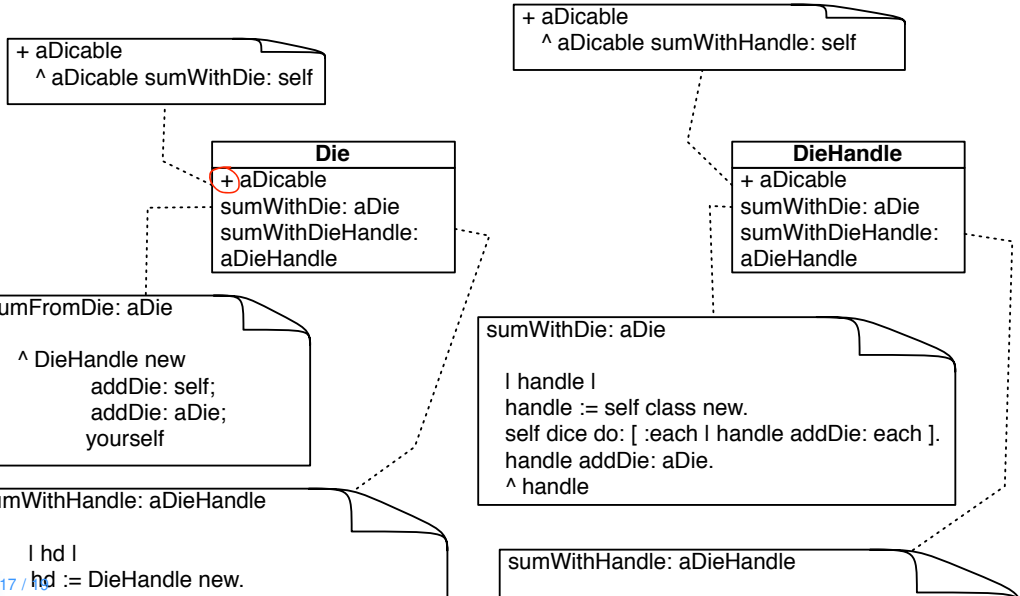
```
DieHandle >> + aDicable
  ^ aDicable sumWithHandle: self
```

```
DieHandle >> sumWithHandle: aDieHandle
  | handle |
  handle := self class new.
  self dice do: [ :each | handle addDie: each ].
  aDieHandle dice do: [ :each | handle addDie: each ].
  ^ handle
```

Now the argument can be a die

```
Die >> sumWithHandle: aDieHandle
  | handle |
  handle := DieHandle new.
  aDieHandle dice do: [ :each | handle addDie: each ].
  handle addDie: self
  ^ handle
```

Double Dispatch between Die and DieHandle



Conclusion

- Basis for advanced design such as the Visitor Design Pattern
- Powerful
- Modular (compiler with 70 nodes scales without problems)
- Just sending an extra message to an argument and using late binding once again
